

Sedimentation Processes and Nutrients Turnover in Acidic Water Bodies during Experimental Treatment for Lake Remediation

By Iglia Gentsheva

GRIN Verlag. Paperback. Book Condition: New. Paperback. 84 pages. Dimensions: 8.3in. x 5.8in. x 0.2in. Bachelor Thesis from the year 2006 in the subject Environmental Sciences, grade: 1, 7, Brandenburg Technical University Cottbus, 42 entries in the bibliography, language: English, abstract: The objective of the study is charactering of the primary flux in an enclosure experiment of chemical and/or biological neutralisation in one of the numerous acidified lakes in the Lusatian mining district, (Germany) and tracing the consequences for the water chemistry, resp. water quality. Sedimentation as one of the most important physical process in the water controls the energy flow through aquatic ecosystems thus normally transporting nutrients to the lake bottom. The rate of seston deposition has great importance for understanding the circulation of organic and mineral matter within a lake and can be regarded as a measure of the nutrient recycling there. Acidity removal amendments (soda ash, organic matter and phosphate) added to the enclosures in different combinations resulted in components specific seston fluxes and in changes in the biological and chemical parameters of the water column. It was found that the addition of neutraliser and organic amendments (ENePo) resulted in a flux of autochthonous particulate matter of 6...
